

37. Create a DataFrame from a Dictionary

Aim

To write a Pandas program to create a DataFrame from a dictionary and display it.

Dataset

Name	Age	Marks
Anu	20	85
Bala	21	78
Cathy	20	90
David	22	75

Python code:

```
1 import pandas as pd
2 data = {
3     "Name": ["Anu", "Bala", "Cathy", "David"],
4     "Age": [20, 21, 20, 22],
5     "Marks": [85, 78, 90, 75]
6 }
7 df = pd.DataFrame(data)
8 print("DataFrame:")
9 print(df)
```

Output

```
DataFrame:
   Name  Age  Marks
0   Anu   20    85
1  Bala   21    78
2  Cathy  20    90
3  David  22    75
```

Result

A DataFrame was successfully created from a dictionary and displayed.

38. DataFrame with Index Labels

Aim

To write a Pandas program to create and display a DataFrame from dictionary data with specified index labels.

Dataset

Index	Name	Age	Marks
S1	Anu	20	85
S2	Bala	21	78
S3	Cathy	20	90
S4	David	22	75

Python code

```
1  import pandas as pd
2  data = {
3      "Name": ["Anu", "Bala", "Cathy", "David"],
4      "Age": [20, 21, 20, 22],
5      "Marks": [85, 78, 90, 75]
6  }
7  df = pd.DataFrame(
8      data,
9      index=["S1", "S2", "S3", "S4"]
10 )
11 print("DataFrame with Index Labels:")
12 print(df)
```

Output

DataFrame with Index Labels:

	Name	Age	Marks
S1	Anu	20	85
S2	Bala	21	78
S3	Cathy	20	90
S4	David	22	75

Result

A DataFrame was successfully created with specified index labels.
