

39. Get the First 3 Rows of a DataFrame

Aim

To write a Pandas program to retrieve and display the first three rows of a given DataFrame.

Dataset

Name	Age	Marks
Anu	20	85
Bala	21	78
Cathy	20	90
David	22	75
Esha	21	88

Python code

```
1 import pandas as pd
2 data = {
3     "Name": ["Anu", "Bala", "Cathy", "David", "Esha"],
4     "Age": [20, 21, 20, 22, 21],
5     "Marks": [85, 78, 90, 75, 88]
6 }
7 df = pd.DataFrame(data)
8 print("First 3 Rows:")
9 print(df.head(3))
```

Output

```
First 3 Rows:
   Name  Age  Marks
0   Anu   20    85
1  Bala   21    78
2  Cathy  20    90
```

Result

The first three rows of the DataFrame were successfully displayed using head(3).

40. Select Name and Score Columns

Aim

To write a Pandas program to select the **Name** and **Score** columns from a given DataFrame.

Dataset

Name	Age	Score	City
Anu	20	85	Chennai
Bala	21	78	Madurai
Cathy	20	90	Coimbatore
David	22	75	Chennai
Esha	21	88	Bangalore

Python code

```
1 import pandas as pd
2 data = {
3     "Name": ["Anu", "Bala", "Cathy", "David", "Esha"],
4     "Age": [20, 21, 20, 22, 21],
5     "Score": [85, 78, 90, 75, 88],
6     "City": ["Chennai", "Madurai", "Coimbatore", "Chennai", "Bangalore"]
7 }
8 df = pd.DataFrame(data)
9 print("Original DataFrame:")
10 print(df)
11 # Select Name and Score columns
12 result = df[["Name", "Score"]]
13 print("\nSelected Name and Score Columns:")
14 print(result)
```

Output

	Name	Score
0	Anu	85
1	Bala	78
2	Cathy	90
3	David	75
4	Esha	88

Result

The Name and Score columns were successfully selected from the DataFrame.
